Who we are

Ampron is an Estonian engineering company that designs and builds industrial LED and LCD display systems for railways, airports, ports, cities and industry. We assemble and test our displays at our own site in Peetri, Estonia, from components bought from specialist manufacturers. Our displays are built to work outdoors and in harsh environments for many years, and we stand behind them for their whole service life.

Our commitment

We take responsibility for the environmental effects of our work: in our building, on the road, in the products we design and in the supply chain we buy from. Ampron commits to:

1. **Comply with the law.** Meet all environmental legislation that applies to us, including Estonian waste, chemicals and producer responsibility law and the EU RoHS, REACH and WEEE rules, and the environmental requirements our customers set.
2. **Use resources carefully.** Track our electricity, heating gas, water and fuel every month, and cut waste of energy and materials at the source.
3. **Know and reduce our emissions.** Keep a yearly greenhouse gas inventory of our direct and energy-related emissions and act on the largest sources: heating, electricity and company vehicles.
4. **Build long-life, efficient products.** Design displays that last and can be repaired at module level. Our LCDs dim automatically to ambient light, and our LED displays run on day and night brightness schedules, with a light sensor available, so they draw no more power than the light conditions need. A display we don't have to replace is the best environmental result we can deliver.
5. **Minimise hazardous substances.** Specify RoHS-compliant components, keep supplier declarations in our technical files and handle the chemicals we use on site safely.
6. **Prevent pollution.** Keep chemicals, oils and electronic waste out of drains, soil and household waste, and store them in marked containers.
7. **Reduce, sort and recycle waste.** Separate paper and cardboard, bio-waste, mixed waste, hazardous waste and electronic scrap, and hand each stream to a licensed handler.
8. **Protect nature.** Work only from existing built premises, take no land from nature for our operations and avoid any discharge that could harm local ecosystems.
9. **Expect the same from suppliers.** Pass these requirements to our suppliers through the Ampron Supplier Code of Conduct.
10. **Involve our people.** Brief every employee and contractor on this policy and on the site environmental instructions when they start, and listen to their improvement ideas.

11 **Improve continually.** Review our environmental performance, this policy and our objectives at least once a year.

Objectives

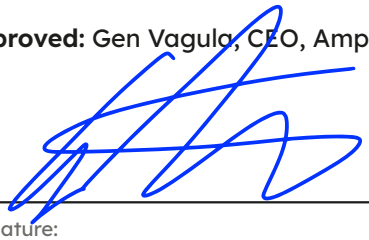

This policy is the framework for Ampron's measurable environmental objectives, set and reviewed in the environmental management system (ENV-02). Against our November 2025 to October 2026 baseline, the current targets are to cut heating gas, electricity and vehicle fuel use by 10% each, and total scope 1 and 2 emissions (about 24 t CO_2e) by 10%, by the end of 2027, and to send 100% of electronic scrap to licensed collectors.

Responsibility

The CEO owns this policy and the environmental management system that carries it out (document ENV-02). Every person who works at or for Ampron follows it in their daily work and reports any spill, leak, waste problem or environmental risk straight away.

This policy is available to employees, customers, suppliers and the public on request and on ampron.eu.
